

Foody — request sequence with the official Just Eat Takeaway.com API

Same installed Slack agent & same steps — only the takeaway hops (4, 9, 10) become API calls

✓ No browser · fully headless · cloud-deployable

— Slack event (Socket Mode) — Slack Web API — Human action — Takeaway partner API (REST + webhook) — Result

0 Installed once → same as today: `manifest.yml` → OAuth bot scopes → **@Foody** bot user → persistent **Socket Mode** WebSocket (`xapp-...`). **New:** Foody also holds a Takeaway **partner API key** + a **webhook endpoint** for order status. Runs **fully headless** — no user's Chrome, deploy anywhere.

✨ What official API access unlocks — blocked today by scraping + browser automation (steps 4 & 9)

RELIABILITY & ACCURACY

- ✓ **No scraping** — structured data, never breaks on a layout change.
- ✓ **Accurate pricing**, promos & vouchers applied programmatically.
- ✓ **Live availability** — sold-out items, modifiers & allergens.
- ✓ **Address validation** & delivery-area checks up front.

NEW CAPABILITIES

- ✓ **Real order + payment** via API — no manual confirm in a browser.
- ✓ **Live delivery tracking** in-thread (accepted → cooking → delivered).
- ✓ **Reorder & history** — “same as last Friday” in one tap.
- ✓ **True bill-splitting** with exact per-item pricing.

SCALE & OPERATIONS

- ✓ **Fully headless** — no user's Chrome; deploy anywhere in the cloud.
- ✓ **Multi-workspace**, many concurrent orders.
- ✓ **Faster** — no browser warm-up, no 24h cache staleness.
- ✓ **Proper retries**, error handling & a real SLA.

🌈 The Slack side is byte-for-byte identical to today — same install, same events, same Block Kit. Only steps 4, 9 & 10 change: brittle browser automation becomes a partner API + status webhook.

Foody · Work hard, skip hangry.
